

build great products™

Jama Connector for JIRA.

Unite product management with development.

The Jama Connector for JIRA integrates two popular solutions used by companies to successfully plan and build new products. This integration will help your organization accelerate development cycles, ensure quality and eliminate costly redundant effort. By connecting Contour with Atlassian JIRA, you can keep your product management and development teams in sync at all times - removing a communication issue that costs companies billions every year.

Two great tools that work together.

Organizations are experiencing greater results by integrating best of breed solutions that specialize in specific areas of the development process. When teams are free to use the tools they prefer, they are dramatically more productive. Now, with the integration of Contour and JIRA, both sides of the organization can work in harmony.

Analysts & PMs use Contour for:

- Requirements management
- Traceability & change control
- Release planning & management
- Robust reporting & document creation

Developers & testers use JIRA for:

- Defects & issues tracking
- Task management
- Sprints & backlog planning
- Agile project management & workflow

Save time, save money.

Without the Jama Connector for JIRA, organizations could spend hours and hours just trying to communicate plans and status of work to each other using either documents or manual imports between systems. With the integration, you can automate this process, and gain back valuable time to devote to more important activities. Whether you're a small start-up or a large global organization, this integration can translate into significant cost savings that you'll realize immediately.

“Our analysts work in Contour and our developers work in JIRA. This integration will save us a tremendous amount of time and ensure our entire organization is in sync on the latest scope and status of what we’re building.”

Cherine Day, *business analyst, Stratos Global*

Key benefits:

Stay connected.

By connecting these two solutions, your organization can leverage the robust traceability and impact analysis features of Contour to create relationships between requirements and all the other downstream items such as tasks and defects. That way, when a change occurs, you can instantly assess its impact on other aspects of your projects and alert the people on your team.

Ensure consistency.

After you've mapped your projects, sets and specific fields between Contour and JIRA, you can configure the JIRA Connector to send items in Contour to JIRA, then keep both systems up to date through the automatic synchronization. Regardless of whether items are updated in Contour or JIRA, you'll have the current status of features, requirements and other items you care about.

Succeed in agile.

Agile is more than just a development methodology, it's a cultural mindset of doing things faster and more collaboratively. This integration supports organizations who are adopting agile techniques in their development process, while still maintaining requirements management best practices.
